Steriscience is a privately held injectables company headquartered at Bengaluru, India, focused on developing value-added sterile injectables that bridge the gap for healthcare workers in the market by improving hospital workflows, reducing wastage of key resources increasing efficiencies as well as ensuring a robust supply chain to ensure reliability of medication to patients worldwide.

Steriscience' roots can be found in Agila Specialties (part of Strides Group up to 2012) which was the leading global player in the sterile injectables space till its acquisition by Mylan in 2013. With a portfolio of 200+ ANDA filings in the US, 180+ filings in other developed markets and several US FDA/EU approved manufacturing plants, Agila was synonymous with the highest standards of quality and trust in the pharmaceutical industry. Agila was acquired by Mylan at a USD 1.6 billion valuation making it one of the largest transactions in Indian Pharma space. September 2020 was our re-entry into the injectables business and saw the inception of Steriscience with a goal to build a speciality injectables company focused on addressing underserved markets.

Headquartered at Bengaluru, India, Steriscience operates 4 production facilities across Bengaluru (India), Warsaw (Poland) & Vadodara, India (under JV with Brooks Laboratories Ltd). With three facilities approved by the USFDA and one with EU GMP accreditations, Steriscience has launched its products in all large markets globally. An integrated pharmaceutical company with a strong command across all aspects of the value chain, we also have a strong inhouse R&D facility at Bengaluru that has completed 25+ product developments in its first year of operation. Work is underway to commission a greenfield API facility at Vadodara to secure backward integration of key anti-infective products.

Led by the team that has delivered several significant outcomes with Agila, Steriscience has an innovation-oriented R&D team with capabilities and rich experience across several domains in injectables. By combining their deep expertise in lyophilisation, efficient manufacturing through cycle optimization, characterization, and development of complex injectables that include iron compounds and other complex drug formulations, and experience across dosage formats of vials, pre-filled syringes, bags, ampoules, cartridges and auto-injectors, our R&D is constantly engaged in providing unique and innovative solutions to meet the demands of healthcare professionals and patients worldwide.

Steriscience is focused on building a global presence across geographies with a combination of its own front-end presence as well as through strong local partnerships in certain markets. With an aggressive go-to-market strategy in place, Steriscience has acquired several approved marketing authorizations and ANDAs to expedite its in-market presence through near-term launches, especially of products recurring on shortage lists in critical care and anti-infective segments that allow Steriscience to meet its goal of addressing underserved segments in the market.
